#### **Today's Agenda**

Practice fitting, evaluating and making point estimates using multiple linear regression models (ch 6)

Justin Leinaweaver (Spring 2022)

#### Multiple Linear Regression: Point Estimates

#### Simple linear regression model

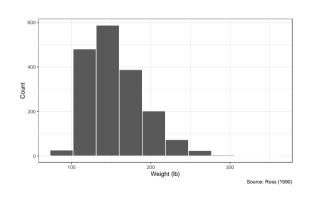

$$Y = \alpha + \beta X$$

#### Multiple linear regression model

$$Y = \alpha + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_k X_k$$

| Predictor 1             |      |
|-------------------------|------|

|                         |      |

## What is the most "useful" model of weight in the Ross (1990) dataset?

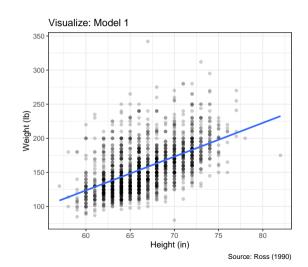

Predictors to Explore

- Height
- Exercise
- Age

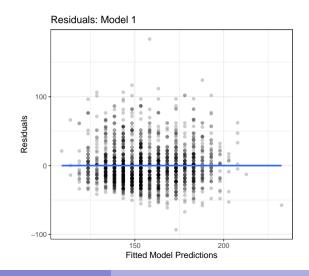

#### Model 1: Regress weight on height

|   | Weight (lb)  |
|---|--|
| Height (in)   | 4.95*<br>(0.18)  |
| Constant  | $-173.26^* \ (11.91)$  |
| Observations<br>Adjusted R <sup>2</sup><br>Residual Std. Error<br>F Statistic | 1,788<br>0.30<br>28.96 (df = 1786)<br>767.70* (df = 1; 1786) |
| Note:   | *p < 0.05  |

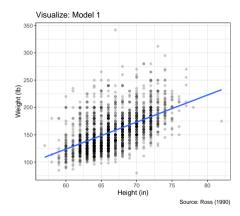

#### Model 1: Regress weight on height

|                         | Weight (lb)                       |
|-------------------------|-----------------------------------|
| Height (in)             | 4.95*                             |
| <b>3</b> ( )            | (0.18)                            |
| Constant                | -173.26*                          |
|                         | (11.91)                           |
| Observations            | 1,788                             |
| Adjusted R <sup>2</sup> | 0.30                              |
| Residual Std. Error     | 28.96 (df = 1786)                 |
| F Statistic             | $767.70^* \text{ (df} = 1; 1786)$ |
| Note:                   | *p < 0.05                         |

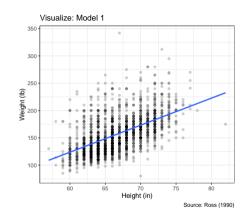

|                         | Weight (lb)               |
|-------------------------|---------------------------|
| Height (in)             | 4.95*                     |
|                         | (0.18)                    |
| Constant                | -173.26*                  |
|                         | (11.91)                   |
| Observations            | 1.788                     |
| Adjusted R <sup>2</sup> | 0.30                      |
| Residual Std. Error     | 28.96 (df = 1786)         |
| F Statistic             | $767.70^* (df = 1; 1786)$ |
| Note:                   | *p < 0.05                 |

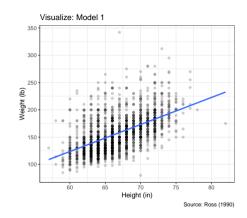

Calculate a PE (w/ 95% PI) for a person of average height (5' 7")

|                         | Weight (lb)                       |
|-------------------------|-----------------------------------|
| Height (in)             | 4.95*                             |
|                         | (0.18)                            |
| Constant                | -173.26*                          |
|                         | (11.91)                           |
| Observations            | 1,788                             |
| Adjusted R <sup>2</sup> | 0.30                              |
| Residual Std. Error     | 28.96 (df = 1786)                 |
| F Statistic             | $767.70^* \text{ (df} = 1; 1786)$ |
| Note:                   | *p < 0.05                         |

Weight = 
$$-173.26 + 4.95 \times (67in) = 158.39lb$$

|                         | Weight (lb)            |
|-------------------------|------------------------|
| Height (in)             | 4.95*                  |
|                         | (0.18)                 |
| Constant                | -173.26*               |
|                         | (11.91)                |
| Observations            | 1,788                  |
| Adjusted R <sup>2</sup> | 0.30                   |
| Residual Std. Error     | 28.96 (df = 1786)      |
| F Statistic             | 767.70* (df = 1; 1786) |
| Note:                   | *p < 0.05              |

 $158.39 \pm 2 \times 28.96 \approx 100.47$  to 216.31 lb

- Put the results into a regression table
- Evaluate the regression with all five steps
  - Logical
  - Statistical Significance
  - Explanatory Power: R2 and F Statistic
  - Check the Residuals
  - Check for Multicollinearity

|                         | Weight (lb)            |
|-------------------------|------------------------|
| Height (in)             | 5.21*                  |
| 3 ( )                   | (0.18)                 |
| Exercise                | -2.05*                 |
|                         | (0.30)                 |
| Constant                | -184.54*               |
|                         | (11.88)                |
| Observations            | 1,788                  |
| Adjusted R <sup>2</sup> | 0.32                   |
| Residual Std. Error     | 28.59 (df = 1785)      |
| F Statistic             | 417.44* (df = 2; 1785) |
| Note:                   | *p < 0.05              |

## 1. Does the model make sense?

|                         | Weight (lb)            |
|-------------------------|------------------------|
| Height (in)             | 5.21*                  |
| <b>3</b> ( )            | (0.18)                 |
| Exercise                | -2.05*                 |
|                         | (0.30)                 |
| Constant                | $-184.54^{*}$          |
|                         | (11.88)                |
| Observations            | 1,788                  |
| Adjusted R <sup>2</sup> | 0.32                   |
| Residual Std. Error     | 28.59 (df = 1785)      |
| F Statistic             | 417.44* (df = 2; 1785) |
| Note:                   | *p < 0.05              |

# 2. Check for statistical significance

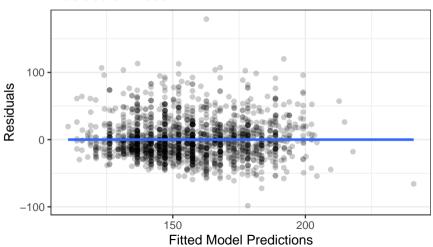

|                         | Weight (lb)            |
|-------------------------|------------------------|
| Height (in)             | 5.21*                  |
| 3 4 ( )                 | (0.18)                 |
| Exercise                | $-2.05^{*}$            |
|                         | (0.30)                 |
| Constant                | $-184.54^{*}$          |
| Constant                | (11.88)                |
|                         |                        |
| Observations            | 1,788                  |
| Adjusted R <sup>2</sup> | 0.32                   |
| Residual Std. Error     | 28.59 (df = 1785)      |
| F Statistic             | 417.44* (df = 2; 1785) |
| Note:                   | *p < 0.05              |

# 3. Determine the explanatory power of the model

|                         | Weight (lb)            |
|-------------------------|------------------------|
| Height (in)             | 5.21*                  |
|                         | (0.18)                 |
| Exercise                | -2.05*                 |
|                         | (0.30)                 |
| Constant                | $-184.54^{*}$          |
|                         | (11.88)                |
| Observations            | 1,788                  |
| Adjusted R <sup>2</sup> | 0.32                   |
| Residual Std. Error     | 28.59 (df = 1785)      |
| F Statistic             | 417.44* (df = 2; 1785) |
| Note:                   | *p < 0.05              |

#### 4. Check for problems in the residuals

Residuals: Model 2

### 5. Check for multicollinearity

|          | height | exercise |
|----------|--------|----------|
| height   | 1      | 0.215    |
| exercise | 0.215  | 1        |

Calculate a point estimate (w/95% PI) for a person of average height (5'7") and average exercise (3).

Calculate a point estimate (w/95% PI) for a person of average height (5'7") and average exercise (3).

ullet Weight pprox -184.54 + 5.21 imes (Height) + -2.05 imes (Exercise)

Calculate a point estimate (w/95% PI) for a person of average height (5'7") and average exercise (3).

- ullet Weight pprox -184.54 + 5.21 x (Height) + -2.05 x (Exercise)
- Weight  $\approx$  -184.54 + 5.21 x (67) + -2.05 x (3)

Calculate a point estimate (w/95% PI) for a person of average height (5'7") and average exercise (3).

- ullet Weight pprox -184.54 + 5.21 imes (Height) + -2.05 imes (Exercise)
- Weight  $\approx$  -184.54 + 5.21  $\times$  (67) + -2.05  $\times$  (3)
- Weight  $\approx$  158.38 lb

#### **Estimate the Prediction Interval (95%)**

Residual Standard Error = 28.59

Weight pprox 158.4 lb

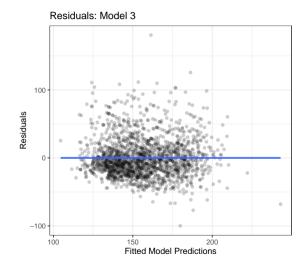

- 95% PI (Low):  $158.38 2 \times 28.59 = 101.2$  lb
- 95% PI (High):  $158.38 + 2 \times 28.59 = 215.56$  lb

|                         | Weight (lb)                       |                        |
|-------------------------|-----------------------------------|------------------------|
|                         | (1)                               | (2)                    |
| Height (in)             | 4.95*                             | 5.21*                  |
| ,                       | (0.18)                            | (0.18)                 |
| Exercise                |                                   | $-2.05^{*}$            |
|                         |                                   | (0.30)                 |
| Constant                | -173.26*                          | $-184.54^{*}$          |
|                         | (11.91)                           | (11.88)                |
| Observations            | 1,788                             | 1,788                  |
| Adjusted R <sup>2</sup> | 0.30                              | 0.32                   |
| Residual Std. Error     | 28.96 (df = 1786)                 | 28.59 (df = 1785)      |
| F Statistic             | $767.70^* \text{ (df} = 1; 1786)$ | 417.44* (df = 2; 1785) |
| Note:                   |                                   | *p < 0.05              |

#### M3: Regress weight on height and age

- Put the results into a regression table
- Evaluate the regression with all five steps
- Calculate a point estimate (w/ 95% PI) for a person of average height (5'7") and average age (43).

|                         | Weight (lb)            |  |
|-------------------------|------------------------|--|
| Height (in)             | 5.15*                  |  |
| 3 7 ( )                 | (0.18)                 |  |
|                         |                        |  |
| Age                     | 0.33*                  |  |
|                         | (0.04)                 |  |
|                         |                        |  |
| Constant                | $-200.94^*$            |  |
|                         | (12.14)                |  |
| Observations            | 1 700                  |  |
|                         | 1,788                  |  |
| Adjusted R <sup>2</sup> | 0.33                   |  |
| Residual Std. Error     | $28.41 \; (df = 1785)$ |  |
| F Statistic             | 434.54* (df = 2; 1785) |  |
| Note:                   | *p < 0.05              |  |

#### M3: Regress weight on height and age

Calculate a point estimate (w/95% PI) for a person of average height (5'7") and average age (43).

- ullet Weight pprox -200.94 + 5.15 imes (Height) + 0.33 imes (Age)
- Weight  $\approx$  -200.94 + 5.15  $\times$  (67) + 0.33  $\times$  (43)
- Weight  $\approx 158.3$  lb

#### M3: Regress weight on height and age

Residual Standard Error = 28.41

Weight pprox 158.3 lb

- 95% PI (Low):  $158.3 2 \times 28.41 = 101.48$  lb
- 95% PI (High):  $158.3 + 2 \times 28.41 = 215.12$  lb

|   | Weight (lb)  |  |   |  |
|---|--|--|---|--|
|   | (1)  | (2)  | (3)   |  |
| Height (in)   | 4.95*<br>(0.18)  | 5.21*<br>(0.18)  | 5.15*<br>(0.18)   |  |
| Exercise  |  | -2.05*<br>(0.30)   |   |  |
| Age   |  |  | 0.33*<br>(0.04)   |  |
| Constant  | $-173.26^* \ (11.91)$  | $-184.54^{*} \ (11.88)$                                      | -200.94*<br>(12.14)   |  |
| Observations<br>Adjusted R <sup>2</sup><br>Residual Std. Error<br>F Statistic | 1,788<br>0.30<br>28.96 (df = 1786)<br>767.70* (df = 1; 1786) | 1,788<br>0.32<br>28.59 (df = 1785)<br>417.44* (df = 2; 1785) | 1,788<br>0.33<br>28.41 (df = 1785)<br>434.54* (df = 2; 1785 |  |

Note:

## M4: Regress weight on height, excercise & age

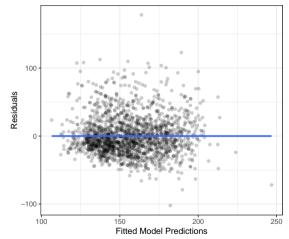

- Put the results into a regression table
- Evaluate the regression with all five steps
- Calculate a point estimate (w/ 95% PI) for a person of average height (5'7"), exercise (3) and average age (43).

|                         | Weight (lb)            |  |
|-------------------------|------------------------|--|
| Height (in)             | 5.29*                  |  |
| <b>3</b> ( )            | (0.18)                 |  |

#### Model 4

Calculate a point estimate (w/95% PI) for a person of average height (5'7"), exercise (3) and average age (43).

- Weight  $\approx$  -203.76 + 5.29 x (Height) + -1.4 x (Exercise) + 0.27 x (Age)
- Weight  $\approx$  -203.76 + 5.29 x (67) + -1.4 x (3) + 0.27 x (43)
- Weight  $\approx$  158.08 lb

#### Model 4

Residual Standard Error = 28.25

Weight pprox 158.08 lb

- 95% PI (Low):  $158.08 2 \times 28.25 = 101.58$  lb
- 95% PI (High):  $158.08 + 2 \times 28.25 = 214.58$  lb

|   | Weight (Ib)  |  |  |   |  |  |

#### For Thursday

Evaluate our four models using Wheelan ch 12

- Model 1: Height
- Model 2: Height and Exercise
- Model 3: Height and Age
- Model 4: Height, Exercise and Age
